closed pull requests 0

The chayns-api provides information and useful functions to your page. The information and functions are provided by react hooks and normal functions. A list of all functions and hooks can be found [here](#).

## Installation

It is recommended to setup your new chayns page with the [create-chayns-app](#).

## Migrate old project

1. Install chayns-api package

```
# NPM
$ npm install chayns-api

# Yarn
$ yarn add chayns-api
```
2. Wrap your App component with the "ChaynsProvider" component. In all components which are under the ChaynsProvider you can use hooks and chayns functions.

```
<ChaynsProvider>
  <App/>
</ChaynsProvider>
```

## Example

---

```
import { useUser } from 'chayns-api';

const FirstName = () => {
  const user = useUser();

  return (
    <div>{user?.firstName}</div>
  );
}
```

## Getting started

---

More information to setup chayns-api can be found in the [documentation](#).

## Troubleshooting

---

Can't resolve 'react-dom/client'

A warning like above can be shown when you are still using react 17. This can be ignored because the react 17 api is used as fallback instead.
